

Solution Brief

DATA CLASSIFICATION

A Security Framework for Controlling Your Enterprise and SAP Data from Boldon James and SECUDE

For a modern-day enterprise, information is one of the most powerful assets. Efficiently organizing and processing this information bolsters its value to the organization. Identifying and labeling unstructured data as business critical, sensitive, meant for internal eyes only, or accessible to the public is an effective first step in achieving this.

A **Data Classification solution** needs to apply persistent metadata to the data generated by systems or created by users, so that informed decisions can be made about how it is managed, protected, and shared, both within and outside the organization. In addition, users need to be made aware of the sensitivity of the information they handle in order to ensure they understand their responsibilities around data safeguarding.

A joint solution from Boldon James and SECUDE

Provides enterprises with a comprehensive classification framework for increased security. By integrating Boldon James Classifier with SECUDE's **Halocore**, companies can identify and classify documents at the moment of their creation both inside and outside of SAP systems for a cohesive and seamless experience across the entire organization.

The primary phase of a Data Classification project involves identifying what your company's most sensitive data is and where it resides. For many enterprises that run on SAP this sensitive information is collected within SAP itself, given that it is the largest Enterprise Resource Planning (ERP) application in the market.

SAP users extract hundreds of documents from SAP systems and applications via emails and spreadsheets for the purpose of analytics, reporting and collaboration. This extraction of sensitive information is a serious security concern for SAP customers, as most enterprises do not have an effective identification, control, or protection framework in place for this unstructured data.

5 Benefits of Data Classification with Boldon James and SECUDE:

- 1 Consistency in handling enterprise data, created both inside and outside of SAP
- 2 Ability to make more effective decisions on the controls needed for data protection
- 3 Lowered costs and compliance efforts on the national and international level
- 4 Improved accuracy of DLP and risk management solutions
- 5 Increased user awareness and accountability for data safeguarding

Boldon James and SECUDE Integration

SECUDE's **Halocore** automates a key aspect of the often-challenging task of data classification by seamlessly integrating with SAP and automatically tagging files with appropriate classification labels based on the customers' classification scheme. Every time a document is created and downloaded from SAP systems, **Halocore** labels or tags the document in a manner compatible with Boldon James Classifier. Boldon James Classifier then continues the downstream management of the SAP exported file ensuring consistent protection throughout its lifecycle.

With Boldon James and SECUDE, you can enjoy the benefits of data classification in the most cohesive, user-friendly, and efficient way. The result is streamlined business processes with data security at the core, reducing risk and allowing you to cut data management costs and ensure compliance with global and national regulations.
